

## Homework #6

Due date: 12/9

### Real constant recognizer

Let  $\Sigma = \{+, -, ., 0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$  be the alphabet of the language of real constants generated by the following finite automaton, where  $d = 0, 1, 2, \dots, 9$ .

The real constants accepted (or recognized) by this finite automaton are of the form

$$s_1 s_1 \cdots s_m d_1 d_2 \cdots d_n . e_1 e_2 \cdots e_p$$

where  $s_i$  is a plus or minus sign,  $d_j$  and  $e_k$  are decimal digits, and  $m, n, p$  satisfy (a)  $m \geq 0$  and (b)  $n \geq 0$  and  $p \geq 0$ , but not both zero.

For examples, the following real constants are accepted

$$12.34 \quad 12. \quad .34 \quad +--+12.34 \quad (1)$$

$$-12.3 \quad +2.3 \quad (2)$$

$$--12.3 \quad ++2.3 \quad (3)$$

but the following aren't

$$123456 \quad 1.2.3 \quad +1..2 \quad .+23 \quad . \quad +--+-. \quad (4)$$

### Comment

The real constants recognized by this finite automaton are essentially those of C/C++. In particular, the real constants in line (1) are also legal constants in C/C++, and those in line (4) are also illegal in C/C++.

However, they differ in that  $+$ ,  $-$ ,  $++$ , and  $--$  are operators in C/C++. Therefore, those in line (2) are expressions, rather than constants, in C/C++; and those in line (3) are ill-formed in C/C++.

Your job is to implement the preceding finite automaton in three ways:

- 1 Represent states as statement labels
- 2 Represent states as enumerators of an enumeration type, say
 

```
enum state {sign,integer,fraction,real,error};
```

 Determine the next state to transit by computation
- 3 Use the same representation as method 2
 

But, this time you shall build a transition table in advance, and determine the next state to transit by table lookup

Hint: A  $5 \times 3$  table suffices. (Why?) DO NOT create a  $5 \times 13$  table.

Hint: Define an **inline** function to map the 13 symbols `+, -, ., 0, 1, 2, 3, 4, 5, 6, 7, 8, 9` into 3 array indices `0, 1, and 2`.

## Requirements

- 1 You shall write three functions, say
 

```
void recognizer1(void);    // for method 1
void recognizer2(void);    // for method 2
void recognizer3(void);    // for method 3
```
- 2 Use the following code to test your recognizers
 

```
#include <stdlib.h>
switch (rand()%3) {
case 0: recognizer1(); break;
case 1: recognizer2(); break;
case 2: recognizer3(); break;
}
```

It is up to you to decide if you want to set a new seed for the pseudorandom number generator.
- 3 See the sample run for the required output format.
 

The sample run uses the default seed. The method used to recognize each test datum may be different if a different seed is employed.

## Sample run

Enter a real constant: 123.45

Accepted by method 3

Enter a real constant: 123.

Accepted by method 3

Enter a real constant: .45

Accepted by method 2

Enter a real constant: +23.456

Accepted by method 2

Enter a real constant: -0.

Accepted by method 3

Enter a real constant: +.0

Accepted by method 2

Enter a real constant: ++--23.45

Accepted by method 1

Enter a real constant: 1234

Rejected by method 1

Enter a real constant: 1..2

Rejected by method 2

Enter a real constant: 1.2.3

Rejected by method 3

Enter a real constant: +12.+34

Rejected by method 3

Enter a real constant: +123.45+

Rejected by method 3

Enter a real constant: .

Rejected by method 2

Enter a real constant: +-+-.

Rejected by method 1

Enter a real constant: ^Z
